

The Earlens® Contact Hearing Solution

We are proud to be a provider of [Earlens](#), the world's first and only hearing solution to directly vibrate the eardrum. Earlens delivers more complete sound than any acoustic hearing aid, and a bandwidth that is associated with more natural sound quality and better hearing in noise.

In Earlens, a Processor worn behind the ear sends an audio signal through the Ear Tip to a custom Lens that rests directly on the eardrum. When the eardrum receives the signal, it gently vibrates the eardrum to activate the ear's natural hearing system.

Most complete sound: Earlens can provide [meaningful amplification](#) from 125 Hz all the way to 10 kHz, while conventional hearing aids have trouble amplifying outside of 550 Hz to 5.5 kHz. But research has shown that those lower and higher frequencies impact sound quality and speech understanding, especially in noisy environments.

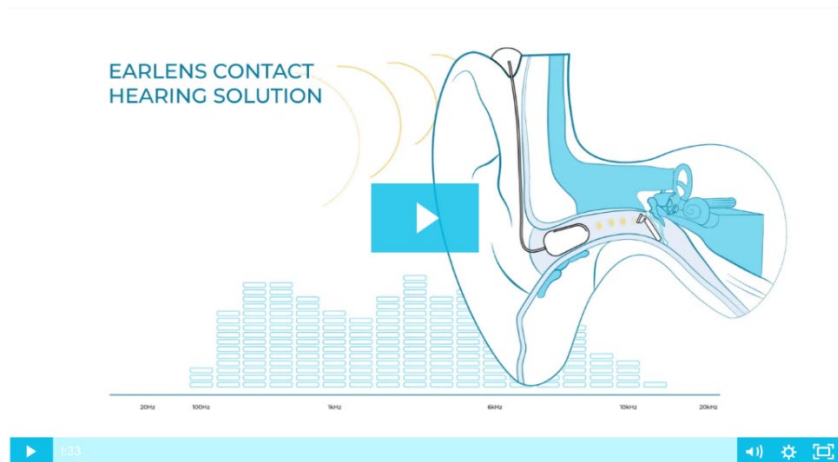

Premium care: Earlens is the only nonsurgical solution that combines the [care of an ENT physician and audiologist](#) or hearing health professional. With Earlens, you will receive the highest level of hearing healthcare.

Advanced, custom technology: Each Earlens solution includes a [custom Ear Tip and Lens](#) to optimize comfort and fit based on an ear impression taken by your physician. After they are ready, your physician will place the Lens in your ear, and your audiologist will program Earlens to your unique hearing needs.
